Q no 1:

PAC Chart

Topic: OTE

INPUT	OUTPUT
• Number of guests (N) • For each guest: - Season (Season: "Peak" or "Off-Peak") - RoomType (RoomType: "Standard", "Deluxe", or "Suite") - Number of Nights (M)	• For each guest - Hotel Price (HP) • Overall - Total Hotel revenue (Total Revenue).
PROCESSING REQUIRED	SOLUTION ALTERNATIVE
• Initialise Total Revenue = 0 • Read N • Loop i from 1 to N: - Read Season, RoomType, and M. - Determine rate using nested Conditions. • If Season == "Peak" Standard = 5000, Deluxe = 8000, Suite = 12000 • If Season == "Off Peak". Standard = 3000, Deluxe = 5000, Suite = 8000 • Calculate Price = Rate * M • If M > 7 Price * 0.15 • Else D = 0	- Decisions can be structured using nested if-else or SWITCH / CASE selection.

Dated: _____

- Compute final bill $FP = Price - D$
- Print Final Price (FP)
- Calculate Total Revenue =
Total Revenue + FP
- Print Total Revenue after loop
finishes.

GPO Chart:

INPUT

- N (Total guests)
- season
- Room type
- m (Nights stayed)

PROCESS

- 1) Initialize Total Revenue = 0
- 2) For each guest
($i = 1$ to N)
 - a. Input season, Room-type, M
 - b. Determine Rate based on season and Room type
 - c. Calculate Price =
Rate * M
 - d. If $M > 7$ then $D = Price * 0.15$, else $D = 0$
 - e. Calculate $FP = Price - D$
 - f. Display FP
 - g. Total Revenue = Total Revenue + FP
- 3) Print Total Revenue.

Output

- Final Price (FP)
- Total Revenue.
